HEARTFAID project: A web based knowledge discovery service

Rajko Horvat, *Ruđer Bošković Institute*

Abstract

   The process of knowledge discovery can be simplified by implementing it as a web based knowledge discovery service. The web interface enables users to keep track of modifications made to the initial dataset, and results obtained from various knowledge discovery tools, thus providing access over internet or intranet whenever user needs to do knowledge discovery or access his data.

   This work demonstrates components and functionality of the knowledge discovery web interface for the Heartfaid platform.
