

## **Report on Project Results of Predictive Modeling in Psychiatric Domain**

Elvira Koić

Within the project „Predictive Models in Health Care“, psychiatric domain was focused on predicting of suicidality. Research was conducted on 300 demobilized Croatian soldiers recovering from PTSD. Set of standardized questionnaires were used for follow up of possible suicidality.

Several professional and scientific papers were published, and some will be submitted by the end of the year ( “Suicidality assessment scales”, “PTSD and suicidality”, “Prediction as a strategy of suicidality prevention”, “Group frame as a predictor of suicidality”, “Suicidality and hospitalization recorded at the Departments for Psychiatry of general hospitals”, “Hopelessness and suicidality”, “The relationship between meaning of life and suicide”, “Hypersomnia - suicidality equivalent”, “Trihotilomania and suicidality”).

As a part of the Croatian Association for Suicide Prevention (HUPS) activities, many public forums on the prevention of suicidality have been organized.
